Combination Problems And Solutions Counting

Solution: This is best thought of in two steps. Step one is to choose the places that the vowels go. Here we are picking three places out of eight, and the order that we do this is not important. This is a combination and there are a total of  $C(8,3) = 56$  ways to perform this step. The remaining five letters may be arranged in  $5! = 120$  ways.

### Solutions for Challenging Counting Problems

There are 10 digits to be taken 5 at a time. a) Using the formula: The chances of winning are 1 out of 252. b) Since the order matters, we should use permutation instead of combination.  $P(10, 5) = 10 \times 9 \times 8 \times 7 \times 6 = 30240$ . The chances of winning are 1 out of 30240.

### Combinations (video lessons, examples and solutions)

Formula for combinations. Combinations can be calculated using either the formula or using a calculator. The formula uses factorials (the exclamation point). Remember that factorials are where you count down and multiply. For example,  $4! = 4 \times 3 \times 2 \times 1 = 24$ . Now, we can look at a few examples of counting with combinations. Examples

### Counting Problems With Solutions

This is a combination problem: combining 2 items out of 3 and is written as follows:  $n C r = n! / [(n - r)! r!]$  The number of combinations is equal to the number of permutations divided by  $r!$  to eliminates those counted more than once because the order is not important. Example 7: Calculate  $3 C 2$   $5 C 5$   
Solution:

Answer: Option A. Explanation: Number of ways of selecting 3 consonants from 7. =  $7 C 3$ . Number of ways of selecting 2 vowels from 4. =  $4 C 2$ .  
Number of ways of selecting 3 consonants from 7 and 2 vowels from 4. =  $7 C 3 \times 4 C 2$ . =  $(7 \times 6 \times 5 \times 3 \times 2 \times 1) \times (4 \times 3 \times 2 \times 1) = 210 = (7 \times 6 \times 5 \times 3 \times 2 \times 1) \times (4 \times 3 \times 2 \times 1) = 210$ .
