The electric motor operation is based on the following points: • At least one of the two magnetic field is generated by a solenoid carrying a current. • Phase relation between the rotor and stator magnetic field (i.e. the load angle) must be always greater than 0° in order to keep the motor in motion (negative angles reverse the rotation).

Fundamentals of motor control - STMicroelectronics

There are four main parts to many continuous brushed DC motors. The rotor (the part that rotates) or armature (in engineering speak the armature is the component of an assembly that turns/pivots and that holds the main current carrying coils that produce a magnetic field) in this tutorial the rotor and armature are used interchangeably, i.e., as they are both the turning component in the center.
